

Understanding of Requirements

Warehouse Operations & Transportation Dashboard

Field	Detail
Prepared for	Mr. Neiraj Kajaria
Prepared by	Deepak Sathelly, Ennea Solutions
Reference	Requirement discussion held 23 July 2026
Purpose	Confirmation of our understanding, prior to scope document

This note summarises what we understood from our discussion. Please review and confirm, or mark corrections, so that we can prepare the detailed scope document on an agreed basis.

1. What We Understood You Need

You are setting up six warehouses across India for automobile-sector. You require a single dashboard giving complete visibility into the operations.

Our key understanding is that this is not primarily a transaction-recording system but also a performance layer above it, built around the KPIs you have agreed with your customers, so that you can:

- See, at any time, whether each warehouse is meeting, exceeding or falling short of the agreed KPI targets.
- Explain to your customer, with supporting data, the reason whenever a KPI or SLA is missed beyond the agreed baseline, shortage of manpower, or shortage of equipment.
- Decide on manpower and equipment requirements, and justify those requests to your management.
- Be aware of a problem before the customer raises it.

2. Scope of Operations to be Covered

2.1 Inbound / Receiving

Each step to be separately recorded and timed: vehicle reporting, dock allocation and attachment, unloading, unpacking, quality and visual inspection, physical counting, gate entry, GRN, staging, and put-away, up to put-away confirmation.

- Domestic and imported shipments to be viewed separately, as the agreed timelines differ.
- Understood target: GRN within 1 day of receipt for domestic and 2 days for imported material, at 95% or above.
- Dock-to-stock time to be reported as a headline measure.

2.2 Outbound / Dispatch

Invoice details continue to be uploaded from SAP through Excel at the scheduled times, after which invoices move through pending, picked, packed and dispatched stages, each stamped against the user who updated it.

- Invoicing throughput to be measured against the daily cut-off with a target of 95–98%.
- Picking to be reported separately by type: case, batch, pallet, box and loose/single picking.
- Packing, staging, gate pass out and dispatch to be timed as distinct activities.
- Please confirm whether kitting and sorting are to be tracked as separate activities for these warehouses.

2.3 Inventory Accuracy

- Cycle counts performed, quantity of parts counted, and variances found.
- Reason recorded against every variance, including the case where a wrong item has been shipped.
- Corrective and preventive action recorded against each variance, so that recurrence can be avoided and demonstrated.

- Inventory accuracy percentage reported per warehouse.

2.4 Manpower and Productivity

- Attendance and shift availability.
- Daily task assignment and allocation.
- Direct productivity (pickers, packers) shown separately from indirect productivity (supervisory staff).
- Productivity measured per person, per hour, and per line or unit, at individual and team level.
- Actual productivity compared against the agreed target for each activity.
- Overtime and additional man-hours treated as an input, so that the revised achievable output is visible when extra hours are deployed.
- Identification of individuals performing below the benchmark within a warehouse.
- Accuracy alongside output, we propose also reporting error rates such as wrong picks, so that speed is not measured in isolation from correctness.

2.5 Equipment (MHE) and Space

- MHE fleet recorded per warehouse, with the pallet movement each unit can handle inbound and outbound per shift, and the effect of battery life on availability.
- Warehouse occupancy reported as space occupied against space available, in percentage terms.
- A next-day planning view showing expected load against available manpower, equipment and space.

2.6 Cost

- Cost per activity, and cost per inbound or outbound batch or shipment.
- Cost compared against productivity, and high-cost cases flagged with the reason.
- Inventory turnover ratio.

2.7 Transportation

To be provided as a second application.

- Vehicles received and vehicles dispatched.
- On-time deliveries against missed deliveries, with the reason recorded for each miss.
- Vendor-wise and route-wise performance, to support a decision to change an underperforming transporter on a particular route.
- Delivery models tracked per customer, including same-day delivery.
- Integration with the TMS to be taken up subsequently.

3. Dashboards, Access and Alerts

View	Understood Coverage
Executive view	All six warehouses together — warehouse health, KPI summary, productivity, pending activities, inventory status, occupancy, cost and SLA achievement, with drill-down to individual transactions.
Site manager view	Own warehouse only — team productivity, daily operations, pending tasks, inventory status and resource availability. No visibility of other sites.
Status indicators	Red / Amber / Green flags across inbound, outbound, inventory, cost, manpower, equipment and operating cost.
Alerts	Automatic alerts by email on KPI breach, SLA violation, delayed delivery, low productivity, inventory variance and capacity constraints.
Reports	Site reports for managers, monthly performance and MIS reports for management, with charts and trend analysis.

Site details such as warehouse manager name, headcount, rental cost and local holidays are also to be held against each warehouse, so that queries can be answered from the dashboard directly.

4. Inputs Required from Your Side

The following are needed before the design can be finalised, and we understood these would be shared by you:

Input	Why It Is Needed
Agreed KPI list, with formula and target for each	The dashboard is built around these; every screen is derived from them.
Activity list, mapped to the KPI each activity supports	To link operational steps to performance measurement.
SOPs for each warehouse activity	To match the activity definitions and labels in the system to your process.
Benchmark data (time per activity)	To set productivity targets.
Customer-wise SLA terms across the six sites	Terms are understood to differ by customer and site.

On benchmarks, we would record these as provisional in the system until your own time-and-motion study is completed, and keep earlier periods measured on the benchmark applicable at that time, so that past performance does not change when the benchmark is revised.

5. Points We Would Like Confirmed

- Warehouses are to be treated as independent operations under a single central view. Stock transfer between warehouses is not required at this stage.
- The six warehouses serve different customers, and KPIs, SLA terms and activity definitions may differ from one customer to another. We propose to build this in from the start.
- Purchase orders, customer billing and accounting remain in SAP and are outside the scope of this dashboard.
- Since invoice data reaches the system through the scheduled Excel upload from SAP, we propose to show clearly when a file has not been received, so that a delayed upload is not read as a shortfall in warehouse performance.
- Comparison between warehouses, where required, to be shown on a normalised basis, as the sites handle different customers and product mixes.
- We will confirm the delivery timeline post acceptance of the scope document.
